

# On the Size of Unions of Lines in $\mathbb{F}_n$ Obeying the Wolff Axiom

Georgiev, Kristian

The paper deals with finding unions of lines in  $n$ -dimensional vector spaces over finite fields which obey the Wolff axiom and have minimal size. We provide an extension of the constructions for three-dimensional vector spaces over finite fields of even prime power order, obtained by Tao in 2002, to a construction for  $n$ -dimensional vector spaces. We determine the size of the union of lines in our construction in  $n$ -dimensional vector spaces over finite fields of even prime power order to be  $O(p^{1.6kn})$  where  $p^{2k}$  is the order of the field. We prove that our construction obeys the Wolff axiom up to a heuristically negligible number of lines.
