

# Synthesis of Cu<sub>2</sub>O/CuO Nanomaterials for Enzymeless Amperometric Detection of Glucose

Lin, Hsuan

Wang, Lin-Jia

A one-pot approach has been developed for the preparation of Cu<sub>2</sub>O nanocubes from cupric nitrate in alkaline aqueous solutions containing fructose and ascorbic acid at 32 degrees Celsius. In the presence of cetyltrimethylammonium bromide, Cu<sub>2</sub>O nanocubes and Cu<sup>2+</sup> ions react to form Cu<sub>2</sub>O/CuO nanomaterials. Relative to Cu<sub>2</sub>O nanocubes, Cu<sub>2</sub>O/CuO nanomaterials possess higher electrocatalytic activity for glucose oxidation. The enzymeless Cu<sub>2</sub>O/CuO electrode allows sensitive detection of glucose, with linearity of the current at 0.6 V vs. Ag/AgCl against glucose concentration over the range of 0-5 mM (R<sup>2</sup> = 0.99). The Cu<sub>2</sub>O/CuO nanomaterial modified electrode has been validated by determination of the concentrations of glucose in serum samples, with a result that is not significantly different from that obtained by a commercial glucose device. We have found that the stable and low-cost electrode can be used for at least 60 cycles of cyclic voltammetry measurements.
