## The Tie Theorems

Krutovskiy, Roman

Theorem. There are general position points A, B, C, P on the projective plane. Let A\_P be the intersection point of lines AP and BC. Analogously define B\_P and C\_P. Take any points A\_1, B\_1, C\_1 on AP, BP, CP, respectively. Let WC be the intersection point of A\_1B\_P and B\_1A\_P. Analogously define points WA and WB. Then lines CW\_C, AW\_A and BW\_B pass through one point. I also generalized this theorem and found interesting related properties. I found and proved all these theorems in this year.
