Which Grass Could Help Reduce Global Warming?

Henze, Connor

Global warming is a real world problem that we each have a responsibility in helping to reduce. My project was to see what type of grass could help reduce global warming. My hypothesis was that if I test different grasses to see which would reduce the temperature the most, then it will be Red Fescue grass. I made twenty terrariums from pop bottles. I planted three different kinds of grasses: Red Fescue, Kentucky Bluegrass, and Rye, in fifteen terrariums and left five with only soil to serve as the control. My carbon dioxide source in each terrarium was a tablespoon of vinegar mixed with one tsp of baking soda. I used a temperature probe and thermometers to measure temperature change in each terrarium. After performing my experiment and recording my data, I found that the control group had an average percent change in temperature of 10.8. Rye grass had an average percent change in temperature of -6.6. The Kentucky Bluegrass had an average percent change in temperature of -6.6. The Kentucky Bluegrass had an average percent change in temperature of -6.6. The Kentucky Bluegrass had an average percent change in temperature of -6.6. The Kentucky Bluegrass had an average percent change in temperature of -6.6. The Kentucky Bluegrass had an average percent change in temperature of -6.6. The Kentucky Bluegrass had an average percent change in temperature of -6.6. The Kentucky Bluegrass had an average percent change in temperature of -6.6. The Kentucky Bluegrass had an average percent change in temperature of -6.6. The Kentucky Bluegrass had an average percent change in temperature of -6.6. The Kentucky Bluegrass had an average percent change in temperature of -6.6. The Kentucky Bluegrass had an average percent change in temperature of -6.6.
