# An Improvement of the Asymptotical Upper Bound for the Cardinality of Sidon Sets of Vectors with Binary Components

Faergeman, Joakim (School: Alssundgymnasiet Sonderborg)

Let $G=(Z_2)^k$. That is, the set of k-dimensional vectors with binary components. We say that a subset of G (call this A) is a 'Sidon Set' if all pairwise sums, $a_i+a_j$ (i<j) in A, are distinct (mod 2). The problem is to estimate the cardinality of A (typically denoted |A|) asymptotically. In this project, we improve the current best upper bound of |A| - provided in 1969 by the Swedish mathematician, Bernt Lindström
