Hydrogen evolution reaction (HER) is a pivotal process for green-energy technologies involved in overall water splitting. One of the biggest challenges for HER is to have low-cost, abundant, stable and high-efficient electrocatalysts. Here, we report that Cr-doped NiS_x (Cr-NiS_x) in situ grown on Ni foam via a facile hydrothermal method. The doped nanoflowers show excellent electrocatalytic performance toward HER. We find that Cr-NiS_x exhibits an excellent HER activity with an ultralow overpotential of 81 mV at 10 mA·cm⁻², better than those of most nickel sulfide catalysts, and good stability. We believe that this work provides a simple approach to design cost-effective and ultra-highly efficient HER electrocatalysts for practical applications.
