

Mobile Carbon Capture - Phase 3

Sushkin, Maya (School: South High Community School)

A mobile carbon capture device to extract CO₂ from car exhaust was designed and built to fit in a normal passenger car, a Toyota Sports Utility Vehicle (SUV). The mobile device was constructed as a fine spray CO₂ scrubber using Potassium Hydroxide (KOH) or Sodium Hydroxide (NaOH) solutions as the CO₂ absorbents. Measurements were conducted using a commercial CO₂ sensor and laptop computer to measure the CO₂ content of the car exhaust inflow and outflow of the scrubber over a test period. Results were calculated and presented to determine the mobile scrubber efficiency and comparison of absorbents.

Awards Won:

Fourth Award of \$500

American Chemical Society: Second Award of \$3,000
