No More Drowning! Preventing Drowning through a Robot Airplane

Aguel, Mohamed Firas

The number of people drowning to death is so high that we need to put an end to this problem. That’s why I thought of sending these people a robot airplane that carries lifelines to prevent them from drowning. The planes take flight from the nearest possible location to reach people as fast as possible and when it reaches the person who is drowning, it will throw him a life jacket which will help him float and therefore survive.
