IR against Piracy

Ezzulddin, Hadaia

Thousands of people work in movie industry. They do earn money by proper selling of their products. But there are some groups of people just simply capture the movie at the cinema. When these movies are available at the internet people can reach and watch them free of cost, without paying the ticked prize for cinema. So the efforts of thousands of people are just being spoiled by piracy. Our project is against the mentioned type of piracy. We do plant IR LEDs in to the curtain of cinema screen. These LEDs are not in the visible spectrum of human eye, so it doesn’ t disturb the audience. But it disturbs the captured movie like a real bulb is shining in the screen, through the camera. By this way the quality of captured movies will be reduced and this will reduce the wish of watching such movies.
