ElHyOS

Naghizade, Elshan

My project is an innovative cloud-based operating system, that is fully compatible with Windows/Android/Linux and can run either on your real machine as a host operating system or in your browser as a web site. ElHyOS Application Store has artificial intelligence, and it can recommend you to install needed software, can even configure GUI for each user, if you answer some questions of it. Also, all your data are automatically synchronizing with ElHyOS's cloud server. So for example you can start playing game on your smartphone and continue playing on your computer (and it doesn't matter for what platform this game was created). This OS is based on Linux Kernel, and all third party software that were used in ElHyOS were open-source.
